Let's Start!

Comparing Hardware and Software Industries.

Learning Outcome:

Identify information about the history of software and its characteristics in simple spoken and written situations.

Ask your partner:

- What do you know about companies that manufacture computers?
- How do you think the development of the inner processes of computers is?

Can Do Statements:

- I can talk about differences between the hardware and software industries.
- I can talk about software for different purposes.
- I can discuss the importance of software industry over the hardware industry.

Let's Explore!

Regina and Matt talk about the difference between hardware and software industries.

Instructions: Read the text below.

Matt: I have an excellent business idea. I want to invest in the hardware and software industries. Do you have any advice?

Regina: You need to choose only one industry.

Matt: Why? Aren't they related?

Regina: Yes, they are, but the hardware industry is very different from the software industry. Although they have always coexisted, they don't have the same characteristics. You know that hardware is about the production and manufacturing of computer devices, right? Well, it has a high cost of entry, so only some largish and wealthy companies can develop hardware. On the other hand, I consider software succeeds out of effort and great knowledge of different programming languages. If you work with software, you won't have any big issues as long as there is enough individual determination.

Matt: In that case, I choose software.

Regina: I think it's the best option. Nowadays, big companies need software developments to improve quality in their processes. Software impacts global economy every day, think about the impact of the GPS technology.

Matt: You're right. Software covers many interesting purposes. I know that in finances you need to use some software; word processors and spreadsheets are some examples of that. There isn't any serious company that doesn't use those software tools. We can also use software to develop games and applications, which become very popular in a short time. That's a huge business advantage.

Regina: Of course! Software has low costs of entry and you reach clients easier than working with hardware. I mean, hardware is very important too because you need computer devices to develop software, but investing in software is a better option for you.

Matt: I know. I don't want to invest in something that may have a dead end. Thank you.

Regina: You're welcome! Remember that hardware or software are both challenging industries. But, if you ask me, the real history of technology starts with software.

Let's Practice!

Matt talks about software purposes.

Instructions: Select the correct option to correctly complete each sentence.

1. There aren't many businesses that (doesn't / don't / not) use software.
2. When you invest in software, it (do not / does not / do) represent an economic loss, it is an opportunity for your business.
3. You can't increase sales if you (doesn't explore / not to explore / don't explore) software uses, such as applications and word processors.

Let's Practice!

Regina gives some advice* to choose between software and hardware.

*Remember that an "advice" is a recommendation.

Instructions: Select the correct answer to complete the sentence.

1. Do not invest in _____ hardware because software becomes successful in a short time.
 - a. some
 - b. any
 - c. something
2. A: Do you have _____ idea about the advantages of investing in hardware?
B: I think is better to invest in software, it's more profitable.
 - a. some
 - b. little
 - c. any
3. A: Do you know _____ software tool useful in the world of finances?
B: Spreadsheets can be an example.
 - a. few
 - b. any
 - c. Some
4. _____ software applications generate a huge impact in the global economy.
 - a. Some
 - b. Little
 - c. Any
5. _____ companies do not accept the challenge of investing in the hardware industry because they know that producing and manufacturing computers is expensive.
 - a. Little
 - b. Some
 - c. Any

Extension Activity

Let's look for further information about the software industry.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look for information about the people that work in the software industry and their tasks.
- Design a brochure to include all the information you find. Use graphs and drawings if you want.
- Share your brochure with a peer and talk about the differences between software and hardware industries.

Self-Assessment

Yes

No

- I search further information about the people that work in the software industry and their tasks.
- I organize that information in a brochure.
- I share my brochure with a classmate and talk about the differences between software and hardware industries.

Target Words

- **cost of entry** (noun): the initial cost of something as it enters into the market
e.g. Well, it has a high cost of entry, so only some largish and wealthy companies can develop hardware.
- **largish** (adjective): kind of large
e.g. You need a largish and wealthy company to develop hardware.
- **determination** (noun): strength or discipline to decide and continue with a project regardless the obstacles
e.g. If you work with software, you won't have any big issues as long as you have enough determination.
- **word processor** (noun): a computer program that stores documents
e.g. In finances, we use word processors to write documents.
- **dead end** (noun): a point where it is not possible to continue
e.g. I don't want to invest in something that may have a dead end.
- **spreadsheet** (noun): a chart that makes numbers easy to compare
e.g. Software covers many interesting purposes. I know that in finances you need to use some software; word processors and spreadsheets are some examples of that.

Learning Points

Simple Present Tense in Affirmative and Negative Statements.

You use **simple present** in **affirmative** and **negative** statements to talk about frequent actions and routines in the present.

For **affirmative statements**, we are going to follow the next structure:

Subject + verb + complement

Let's take a look at the following example:

*Hardware and software **work** hand in hand.*

Now, when you write an **affirmative statement in simple present** using the **third person of the singular**, you need to add an -s, -es, or -ies at the end of the sentence:

*The company **works** on software development.*

In **negative statements**, we follow the next structure:

*Subject + auxiliary verb in negative (don't / do not or doesn't / does not)
+ verb (base form) + complement*

Example:

*Hardware and Software industries **do not focus** on the same projects.*

When you use the **third person of the singular** in a **negative statement**, you do not need to modify the verb at the end because the auxiliary is already there.

Example:

*She **does not work** in the hardware industry.*

In the chart below, you'll find the same example for all the pronouns that exist in the English language. These examples will help you remember the rules for conjugation in simple present tense:

Learning Points

Subject	Affirmative Statement	Negative Statement
I	study the difference between hardware and software industries.	don't study the difference between hardware and software industries.
You	study the difference between hardware and software industries.	do not study the difference between hardware and software industries.
He, She, It	studies the difference between hardware and software industries.	doesn't study the difference between hardware and software industries.
We	study the difference between hardware and software industries.	don't study the difference between hardware and software industries.
They	study the difference between hardware and software industries.	do not study the difference between hardware and software industries.

Examples

- *I have an excellent business idea. I want to invest in the hardware and software industries.*
- *Although they have always coexisted, they don't have the same characteristics.*
- *Big companies need software developments to improve quality in their processes.*
- *Software impacts global economy every day, think about the impact of the GPS technology.*
- *Software covers many interesting purposes.*

Learning Points

Some and Any.

You use **some** and **any** to measure countable and uncountable nouns.

We use **some** when we talk in affirmative sentences and it describes an unspecified quantity. It means few (for countable nouns) or little (for uncountable nouns).

Example: *I know how **some** hardware devices work.*

We can also use **some** in questions for offering something.

Example: *Would you like to know **some** information about the software industry?*

On the other hand, you use **any** in negative statements for countable and uncountable nouns.

Example: She **doesn't know any** national company that works in the hardware industry.

We can also use **any** for questions.

Example: *Is there **any** great advance in software development?*

Examples

- *I know that some software are for financial use where we use word processors and spreadsheets.*
- *Do you have any advice?*
- *Well, it has a high cost of entry, so only some largish and wealthy companies can develop hardware.*
